**Mesa Corporation Launches NetCapture module as a new
enhancement to the Network Scanning suite.**

Allows scans from any multifunction peripheral (MFP) on the network

Lincoln, Neb. – September, 16 2008 — Mesa Corporation, an industry leader in document and information management, today launched significant enhancements to their Network Scanning software suite. The NetCapture module allows the user to utilize the “Scan to Folder” functionality on networked MFPs. The MFP sends the document to a ‘holding folder’ on the network for easy access by approved users. The files are waiting for the user in the designated folder when they return to their desk. Users then download documents from the ‘holding folder’ into the Mesa’s NetID software for identification. NetID automatically processes any identifying barcodes on the documents. Mesa Corporation has made it easier for everyone to enjoy the full benefits and functionality of their Multi-Function Peripherals. Thus the argument for deploying these devices and making them available across Local Area Networks becomes even more compelling when utilized with the Archive Plus system.

About Mesa Corporation

Established in 1990, Mesa Corporation provides cost-effective document management systems for companies needing to manage data, including text, images, audio, video and databases. Its systems are modular in design and incorporate the latest mass storage technologies to provide solutions for single departments to enterprise wide applications. Mesa’s clients include medical, government, media, insurance, retail and manufacturing.
